CASE STUDY

Restaurant Data Analysis with SQL

Q-1: SQL query to find the top 5 highest-rated restaurants in Koramangala

```
SELECT
    name,
    AVG(rating) AS avg_rating,
    COUNT(votes) AS total_votes
FROM Restaurants
WHERE location = 'Koramangala'
GROUP BY name
ORDER BY avg_rating DESC
LIMIT 5;
```

Q-2: SQL query to list all unique cuisines in Indiranagar with count of restaurants

```
SELECT
    cuisine, COUNT(*) AS restaurant_count
FROM Restaurants
WHERE location = 'Indiranagar'
GROUP BY cuisine
ORDER BY restaurant_count DESC;
```

Q-3: SQL query to calculate average cost for two by restaurant type

```
SELECT
    restaurant_type,
    AVG(cost_for_two) AS avg_cost
FROM Restaurants
GROUP BY restaurant_type
ORDER BY avg_cost DESC;
```

Q-4: SQL query to find restaurants with rating below 3.0 but more than 200 votes

```
SELECT
    name,
    city,
    rating,
    votes
FROM Restaurants
WHERE rating < 3.0 AND votes > 200;
```

Possible Marketing Action

These restaurants have low ratings but high visibility. Suggested actions:

- Offer discounts or loyalty programs to attract repeat customers.
- Partner with food delivery apps for promotional campaigns.
- Host events or chef specials to improve customer perception and ratings.

Q-5: SQL query to segment restaurants into Budget, Mid-range, and Premium categories

```
SELECT name, cost_for_two,
    CASE
        WHEN cost_for_two < 500 THEN 'Budget'
        WHEN cost_for_two BETWEEN 500 AND 1500 THEN 'Mid-range'
        ELSE 'Premium'
    END AS market_category
FROM Restaurants;
```
